

ELECTRONIC COMMERCE SYSTEM USER INTERFACE HAVING GRAPHICAL INDICATORS WITH AUTOMATICALLY ADJUSTED SET POINTS

ABSTRACT

A system includes a user interface software module that presents a user interface having a plurality of graphical indicators that represents respective ranges of available options associated with a set of items available from an electronic commerce system. The user interface software module selects one of the items based on an adjustment to one of the graphical indicators by a user, and automatically adjusts at least one of the other graphical indicators based on the selected one of the items.
